

Software Requirements Specification (SRS) – Food Delivery App

Sample SRS with Peer Review of Ambiguous Requirements

1. Introduction

This SRS defines requirements for a food delivery application similar to Zomato. The application allows customers to discover restaurants, view menus, place orders, make payments, track deliveries, and provide ratings.

2. User Roles

Customer: searches restaurants, orders food, pays, tracks orders, and rates restaurants. Restaurant Partner: manages menu items and accepts or rejects orders. Delivery Partner: receives delivery assignments and updates delivery status. Admin: manages users, restaurants, orders, payments, and complaints.

3. Functional Requirements

FR-01: The system shall allow users to register and log in using a mobile number and OTP.

FR-02: The system shall display nearby restaurants based on the user's location.

FR-03: Users shall be able to search for restaurants and food items.

FR-04: Users shall be able to add food items to a cart and place an order.

FR-05: Users shall be able to pay using supported online payment methods or cash where available.

FR-06: The restaurant shall receive new orders and be able to accept or reject them.

FR-07: The system shall allow users to track the status of an active order.

FR-08: Users shall be able to rate and review completed orders.

4. Non-Functional Requirements

NFR-01: The application should respond quickly to user actions.

NFR-02: The application should be secure and protect user payment information.

NFR-03: The application should be available most of the time.

NFR-04: The application should work on common Android and iOS devices.

5. Assumptions and Dependencies

The user has an internet connection and location services may be used for restaurant discovery. Payment processing depends on a third-party payment gateway. Delivery tracking depends on location/GPS services.

Peer Review – Unclear or Ambiguous Requirements

ID	Requirement	Problem / Why Ambiguous	Suggested Improvement
AR-01	FR-02: Display nearby restaurants	It does not have a defined distance or location	Define a measurable radius, e.g. restaurants within 10 km of the user
AR-02	NFR-01: The application should respond quickly	Quickly is subjective and cannot be tested	Specify the response time, e.g. 95% of normal user requests shall be responded to within 2 seconds
AR-03	FR-05: Pay using supported online payment methods	Supported payment methods are not defined	List supported payment methods and define when cash payments are available
AR-04	FR-07: Users shall be able to track their orders	The data used for tracking is not specified	Define statuses such as Confirmed, Preparing, Picked Up, Out for Delivery
AR-05	NFR-03: The application should be available most of the time	Most of the time is not measurable	Specify an availability target, e.g. 99.5% monthly uptime excluding scheduled maintenance
AR-06	FR-08: Users shall be able to rate and review restaurants	It does not state what the review can be submitted for	Define rating scale, rating criteria (e.g. 1-5), review length, and editing rules

Peer Review Conclusion

The SRS covers the main customer, restaurant, delivery, payment, and tracking functions, but several requirements use subjective terms such as “nearby,” “quickly,” “supported,” “where available,” and “most of the time.” These should be replaced with measurable and testable values before development and testing begin. Clear requirements reduce misunderstandings and make test-case design easier.
